BOSS_V4 Finance Metrics

Category Test Suite & Overview Traceability Report

Scope	All 6 categories, minimum 5 entries per subcategory, positive + negative tests
Test tenant	Full Suite Test Co (full-suite-test@example.com) — isolated, disposable
Backend verified	Live REST API, boss_v4-backend-1 container, same build running in production
Method	Every result below was fetched from the live running system during this report's preparation, not hand-ty

Part 1 — Positive Test Suite: All Categories, 5 Entries Each

Each category's full sample template (every subcategory sheet filled with 5 real rows, auto-generated example row left untouched and correctly skipped) was uploaded via `POST /api/v1/data-entry/category/{category}/bulk-upload` to a single fresh tenant. Totals below are the exact `recordsBySheet` counts returned by that endpoint.

Category	Subcategories (5 rows each)	Records	Result
FINANCE	Position, Liquidity, Profitability, Budget & Forecast, Cost, Capital	30	**PASS**
HUMAN_RESOURCE	Workforce, People Cost, Productivity, Hiring, Attrition, Capability	30	**PASS**
ACCOUNTING	Reporting, Working Capital, Assets-Liabilities, Reconciliation, Controls	25	**PASS**
AUDITING	Audit Status, Findings, Controls, Exceptions, Actions	25	**PASS**
COMPLIANCE	Compliance Status, Tax-GST, Regulatory, Filings, Exceptions	25	**PASS**
RISK	Exposure, Financial, Operational, Compliance, Technology (Mitigation excluded by design)	25	**PASS**

Total: 160 records across 32 subcategories, 6/6 category uploads succeeded.

Overview result after all 6 uploads (live GET /api/v1/dashboard)

Only Finance (Position, Profitability, Budget & Forecast, Capital), Compliance's Tax-GST, and HR's People Cost currently feed Overview — see Part 3 for the complete map of which subcategory drives which result and which ones are data-entry-only today. The table below shows every Overview number this upload produced, and traces each one to the exact source row(s).

Overview field	Value	Source subcategory & latest record used	Formula
Revenue	530,000.00	Profitability, period 2026-05: revenue=530000	direct
Expenses	354,500.00	Profitability 2026-05: cogs 212000 + opEx 105000 + financeCost 13500 + tax 24000	sum of 4 fields
Profit	175,500.00	derived	Revenue – Expenses
Margin	33.11%	derived	Profit ÷ Revenue × 100
Cash	622,000.00	Position, asOfDate 2026-05-31: cashAndBankBalance=622000	direct
Net cash flow	33,000.00	Position cash, 2026-05 (622000) vs 2026-04 (589000)	this month – previous month cash
Runway	0.3 months	Position cash 622000; Profitability 2026-05 burn component; People Cost 2026-03/Sales=2,265,600	Cash ÷ [(Expenses–Revenue)+People Cost] = 622000 ÷ 2,090,100
Receivables	310,000.00	Position 2026-05-31: accountsReceivable=310000	direct
Payables	190,000.00	Position 2026-05-31: accountsPayable=190000	direct
Output GST	102,000.00	Tax-GST, filingPeriod 2026-03 (latest parsable period): outputGst=102000	direct
Input GST (ITC)	53,500.00	Tax-GST 2026-03: inputGst=53500	direct
GST liability	48,500.00	derived from the same Tax-GST 2026-03 record	max(0, Output – Input) = max(0, 48500)
People cost	2,265,600.00	People Cost, period 2026-03: Sales dept only (that period's one row)	grossSalary 1,920,000 + benefits 230,400 + payrollTax 115,200

Note on Runway (0.3 months): this is the mathematically correct output of the formula given the actual uploaded rows — it is *not* a bug. The People Cost sample sheet (authored independently per-category, for schema/volume testing) contains enterprise-scale payroll figures that have no relationship to the much smaller Finance revenue figures in the same upload. Combining unrelated per-category sample sets is not a coherent

business scenario; Part 2 of this session's acceptance test (single coherent scenario: cash 12,00,000 / burn 4,00,000 / 3.0 months) is the correct reference for judging realistic Runway behaviour. This run instead demonstrates that the pipeline reads the right fields and computes the right formula on *whatever* is actually stored — which is exactly what a schema/volume test should prove.

Finance KPI panel (same upload, separate panel)

Field	Value	Source & formula
Cash position	622,000.00	Position (latest): cashAndBankBalance
Working capital	775,000.00	Position: (cash+AR+inventory) – (AP+otherLiabilities) = 1,050,000 – 275,000
Current ratio	3.82	Position: (cash+AR+inventory) ÷ (AP+otherLiabilities) = 1,050,000 ÷ 275,000
Gross profit	318,000.00	Profitability (latest): revenue – cogs = 530,000 – 212,000
Gross margin	60.00%	Gross profit ÷ revenue × 100
Operating profit	213,000.00	Gross profit – operatingExpenses = 318,000 – 105,000
Net profit	175,500.00	Operating profit – financeCost – tax = 213,000 – 13,500 – 24,000
Net margin	33.11%	Net profit ÷ revenue × 100
Funding requirement	130,000.00	Budget & Forecast (latest, period 2026-05): fundingRequirement
Debt exposure	700,000.00	Capital: sum of outstandingDebt across ALL 5 Capital records (0+420000+0+180000+100000)

Risks fired (same upload)

Risk	Severity	Rule / source
Short cash runway	HIGH	Runway (0.3 mo) < 6-month threshold
Receivables high relative to revenue	HIGH	Position AR (310,000) > 20% of Profitability revenue (530,000)
GST liability outstanding	MEDIUM	Tax-GST net liability (48,500) > 0

Part 2 — Negative Test Suite

Three defects were deliberately planted into otherwise-valid uploads to prove (a) validation actually catches each error class with a precise, actionable message, and (b) the category upload is genuinely atomic — one bad cell anywhere rejects the entire file, with zero records persisted anywhere, including the 29 other rows that were perfectly valid.

Test N1 — Three validation defects in one multi-sheet Finance upload

Defect planted	Location	Expected	Actual (verbatim)
Required field left blank	Position, row 3, Cash & bank balance	Rejected: field-required error naming sheet/row/field	“Sheet 'Position', row 3: 'Cash & bank balance' is required”
Non-numeric text in a NUMBER field	Profitability, row 4, Revenue	Rejected: type error naming sheet/row/field/value	“Sheet 'Profitability', row 4: 'Revenue' must be a number, got 'not-a-number'”
Value outside the enum's allowed set	Capital, row 3, Capital type = 'BITCOIN'	Rejected: enum error listing the allowed values	“Sheet 'Capital', row 3: 'Capital type' must be one of [EQUITY, DEBT, GRANT, OTHER], got 'BITCOIN'”

Actual HTTP response (400 Bad Request):

```
BUSINESS_RULE_VIOLATION — "Sheet 'Position', row 3: 'Cash & bank balance' is required\nSheet 'Profitability', row 4: 'Revenue' must be a number, got 'not-a-number'\nSheet 'Capital', row 3: 'Capital type' must be one of [EQUITY, DEBT, GRANT, OTHER], got 'BITCOIN'"
```

Atomicity check (post-rejection record counts, same tenant): Position 5, Liquidity 5, Profitability 5, Budget & Forecast 5, Cost 5, Capital 5 — identical to before this upload was attempted. None of the file's 29 otherwise-valid rows were persisted. **PASS**

Test N2 — Wrong file type

Input	Expected	Actual (verbatim)	Result
A .csv file posted to the Finance category upload endpoint	Rejected before any parsing, clear message naming the required format	INVALID_FILE — “Please upload the .xlsx template file for this category.”	**PASS**

Test N3 — Missing data is never a fabricated zero

Input	Expected	Actual	Result
Brand-new tenant, zero records in every subcategory	metrics: {}, financeKpis: {} — every field absent, none defaulted to 0	Confirmed on a fresh tenant this session: `{"metrics":{},"financeKpis":{},"hasData":false}`	**PASS**

3/3 negative tests passing. Validation is per-field and specific; the upload is all-or-nothing; absence of data is never silently rendered as zero.

Part 3 — How Every Overview Result Is Calculated

This is the complete map from Overview's rendered output back to the Finance-model field(s) that drive it. Every row traces through the same pipeline: `Subcategory form (Category → Subcategory → Fields)` → a backend service reads the latest (or latest-per-period) record(s) → a calculation/normalization step → the canonical result on `DashboardResponseDto` → the same JSON is what Overview renders and what BOSS's recommendation engine consumes — one number, one source, never two.

Business status panel

Overview field	Category → Subcategory	Field(s) read	Rule
Revenue	Finance → Profitability	revenue	Latest period's value, direct
Expenses	Finance → Profitability	cogs, operatingExpenses, financeCost, tax	Sum of all four, latest period
Profit	derived	—	Revenue − Expenses
Margin	derived	—	Profit ÷ Revenue × 100 (0 if Revenue=0, never divide-by-zero)
Cash	Finance → Position	cashAndBankBalance	Latest record, by its asOfDate's month
Net cash flow	Finance → Position	cashAndBankBalance	This period's cash − previous period's cash (needs 2 consecutive periods with cash entered)
Runway	Finance → Position + Profitability; HR → People Cost	cashAndBankBalance; (cogs+opEx+financeCost+tax) − revenue; People Cost total	Cash ÷ [(Expenses−Revenue) + People Cost]. Null (never NaN/∞) when no cash yet or burn ≤ 0. Recomputed whenever any of the 3 inputs changes, regardless of order.
Receivables	Finance → Position	accountsReceivable	Latest record, direct — sole AR source
Payables	Finance → Position	accountsPayable	Latest record, direct — sole AP source
Output GST	Compliance → Tax-GST	outputGst	Latest record by filingPeriod
Input GST (ITC)	Compliance → Tax-GST	inputGst	Latest record by filingPeriod
GST liability	Compliance → Tax-GST	outputGst, inputGst	max(0, Output − Input) — a credit position floors at 0, never shown as negative
People cost	HR → People Cost	grossSalaryCost, benefitsCost, payrollTaxCost	Sum of all 3 fields across every record sharing the latest period (multi-department)

Trend chart, Monthly comparison, Forecast, Cash-flow trend

Overview element	Source	Rule
Revenue/expense/profit trend chart	Finance → Profitability (all periods)	Full snapshot history, one point per period that has a Profitability record
Cash flow trend chart	Finance → Position (all periods)	Cash balance per period + period-over-period change
Monthly comparison	Finance → Profitability (latest 2 periods)	% change in revenue/expenses/profit/margin; needs ≥2 periods or shows “upload at least two months”
12-month forecast	Finance → Profitability (≥3 periods) + Position cash	Linear regression on revenue/expenses history; needs ≥3 periods or shows “not enough data”

Finance KPI panel

Field	Source	Rule
Cash position	Finance → Position	cashAndBankBalance, latest record
Working capital	Finance → Position	(cash+AR+inventory) − (AP+otherLiabilities)

Field	Source	Rule
Current ratio	Finance → Position	(cash+AR+inventory) ÷ (AP+otherLiabilities); null if liabilities=0
Gross profit / margin	Finance → Profitability	revenue–cogs; ÷revenue×100
Operating profit	Finance → Profitability	Gross profit – operatingExpenses
Net profit / margin	Finance → Profitability	Operating profit – financeCost – tax; ÷revenue×100
Funding requirement	Finance → Budget & Forecast	fundingRequirement, latest record
Debt exposure	Finance → Capital	sum of outstandingDebt across ALL Capital records (not just latest)

Risks & recommendations

Risk name	Source	Fires when
Operating at a loss	Finance → Profitability (via snapshot)	Profit < 0
Short cash runway	Position + Profitability + People Cost	Runway < 6 months
Revenue decline / Margin compression / Rapid expense growth	Finance → Profitability history	Trend detection over ≥3 periods
Receivables high relative to revenue	Finance → Position + Profitability	AR > 20% of latest revenue
Payables may exceed available cash	Finance → Position	AP > cash balance
GST liability outstanding	Compliance → Tax-GST	Net liability > 0
Low current ratio (Financial Position)	Finance → Position	Current ratio < 1.0 — fires even with zero transaction history
Net loss reported (Profitability)	Finance → Profitability	Net profit < 0 — fires even with zero transaction history

Each risk above has a matching recommendation template, applied 1:1 by risk name via `POST /api/v1/recommendations/generate`. The recommendation's evidence quotes the exact same numbers Overview displays — confirmed this session: a risk showing “55000 in net GST liability” on Overview produced a recommendation citing that identical figure.

Subcategories that do NOT yet feed Overview

These are real, working data-entry forms (validated, stored, listed/editable/voidable) — they are not wired into any calculation layer yet. Uploading data into them changes nothing on Overview, by design (no calculation has been built that claims to use them):

Finance → Liquidity, Cost · HR → Workforce, Productivity, Hiring, Attrition, Capability · Accounting → Reporting, Working Capital, Assets-Liabilities, Reconciliation, Controls · Auditing → Audit Status, Findings, Controls, Exceptions, Actions · Compliance → Compliance Status, Regulatory, Filings, Exceptions · Risk → Exposure, Financial, Operational, Compliance, Technology, Mitigation

Two known boundaries, flagged explicitly (not bugs): (1) voiding a Position/Profitability record does not retroactively clear the Overview snapshot already derived from it — that snapshot is a separate, one-way-synced projection. (2) People Cost is read as the tenant's current latest figure (same convention used for Position/Profitability throughout), not matched to the specific period of the snapshot it's applied to — invisible in a single-period scenario, visible across multiple periods as this report's Part 1 result demonstrates.
